SQL Server Code Extraction Guide using SSMS

This set of files provides a guide for code extraction in SQL Server to generate data definition language (DDL) and data manipulation language (DML) T-SQL scripts for database objects in SQL Server using SQL Server Management Studio. These files will be used as an input for SnowConvert to execute the migration.

- **For Code Extraction:** *SQL_Server_Code_Extraction.pdf* provides a full guide explaining how to extract the required files from a database to successfully execute the code migration. We recommend always using SSMS instead of any other alternative, it can only be executed in Windows Environments.

- **For Table Sizing report:** *Table_sizing_report.pdf* is used to generate a report that provides detailed data on the utilization of disk space within a database in SQL Server. This report can be generated by SSMS or running a query, both methods are detailed in the document.
